Test 2

1-4. soruları aşağıdaki parçaya göre yanıtlayınız.

Each and every day, millions of Americans are unknowingly exposing themselves to toxic chemicals. In 1938 the FDA granted the personal care industry the power to regulate itself. Therefore, products can be marketed without government approval of ingredients, regardless of what tests show. The ingredients are easily come by and cheap, so they can help companies make a profit. They are found in toothpaste, soap and many skin products. There are, in fact, more than 125 ingredients used on the skin suspected of causing cancer. They do this by entering the body through the skin. There are four common chemicals that go into these products, and all of them can be said to have one negative effect or another on the body. Fragrances are chemicals that have a good smell, but some have been found to cause dizziness, while coloring agents have been known to cause irritation of the skin.
